Geometric measure theory (GMT), born in the 1960's, is a generalization of calculus and differential geometry to the realm of "non-smooth" geometric objects. GMT helped solve Plateau's Problem, posed in 1760 (!) by Lagrange.

Geometric measure theory uses techniques from geometry, measure theory, analysis, and partial differential equations. This book showcases all these methodologies, and explains the ways in which they interact. The result is a rich symbiosis which is both rewarding and educational.

Steven G. Krantz Harold R. Parks

A major concern in geometric measure theory is finding criteria which guarantee rectifiability. One of the most striking results in this direction is the Besicovitch–Federer projection theorem, which illustrates the stark difference between rectifiable and unrectifiable sets.
