In this text Kepler derives his famous equation that solves two-body orbital motion,  $M = E \sin E$ , where  $M$  (the mean anomaly) and  $e$  (the eccentricity) are known, and one solves for  $E$  (the eccentric anomaly).

Numerical Analysis II - ARV 4 2017-18 Lecture Notes Even if our computer could do exact real arithmetic, there would still be an error resulting from stopping our iterative process at some finite point. This is called truncation error. We will be concerned with controlling this error and designing methods which converge as fast as possible.

The basic problem is to solve linear equations for unknowns, i.e.  $Ax = r$ , where  $A$  is an  $n$  by  $n$ (square) matrix,  $x$  is the (column) vector of the unknowns, and  $r$  is similarly a vector of the right hand side values.

In this lecture, we will discuss numerical methods for the Root-Finding Problem. As the title suggests, the Root-Finding Problem is the problem of finding a root of the equation  $f(x)=0$ , where  $f$  is a function of a single variable. Specially, the problem is stated as follows: The Root-Finding Problem Given a function  $f(x)$ , find  $x$  such that  $f(x)=0$ .

Indeed, the reason for the importance of the numerical methods that are the main subject of this chapter is precisely that most equations that arise in "real" problems are quite intractable by analytical means, so the computer is the only hope. Despite the above disclaimer, in the next section we will study yet another important
